2017 Heart Failure Epidemiology

- At age 40, lifetime risk of developing HF is 20%, >900,000 new cases per year
- **>1 million annual hospitalizations**
 - Case fatality following HF hospitalization
 - 10% at 30 days
 - 22% at 1 year
- >1.7 million office visits
 - (1.7:1 ratio vs. 7:1 ratio for CHD)
- Cost: 2012: \$21 billion
2030: \$70 billion (\$244/US citizen)

2017 Heart Failure Epidemiology: The Disease Spectrum

Heart Failure Prevalence

ACC/AHA Staging of Heart Failure Patients

At Risk for Heart Failure

Heart Failure

Stage A

At high risk for HF, but without structural heart disease or symptoms of HF

Patients with:

- HTN
- Atherosclerotic disease
- DM
- Obesity
- Metabolic syndrome
- Or
- Patients using cardiotoxins with FHx CM

Structural Heart Disease

Stage B

Structural heart disease, but without signs or symptoms of HF

Patients with:

- previous MI
- LV remodeling, including LVH and low EF
- asymptomatic valvular disease

NYHA I

Development of symptoms of HF

Stage C

Structural heart disease with prior or current symptoms of HF

Patients with:

- known structural heart disease and
- shortness of breath and fatigue, reduced exercise tolerance

NYHA II-III

Refractory symptoms of HF at rest

Stage D

Refractory HF requiring specialized interventions

Patients with:

marked symptoms at rest despite maximal medical therapy (eg, those who are recurrently hospitalized or cannot be safely discharged from the hospital without specialized interventions)

NYHA IV

MASSACHUSETTS
GENERAL

INSTITUTE FOR
VASCULAR AND STROKE CARE

DM=diabetes mellitus; HTN=hypertension; LV=left ventricular; FHx= family history; CM=cardiomyopathy

Hunt SA et al. *Circulation*. 2005;112:1825–1852.

Does My Patient Have Heart Failure?

Definition of Heart Failure

- Heart Failure Definition: Clinical syndrome that can result from any structural or functional cardiac disorder that impairs the ability of the ventricle to fill with or eject blood
 - Framingham Criteria: 2 MAJOR or 1 MAJOR + 2 MINOR

MAJOR CRITERIA

Paroxysmal nocturnal dyspnea
Radiographic cardiomegaly
Acute pulmonary edema
Weight loss > 4.5kg in 5 days with Rx
Neck vein distention
Rales
S3 Gallup
Increased CVP (>16)
Hepatojugular reflux

MINOR CRITERIA*

Bilateral ankle edema
Heart rate > 120
Hepatomegaly
Nocturnal cough
Dyspnea on ordinary exertion
Pleural effusion
Reduced vital capacity by 1/3

* Minor criteria only acceptable if not attributable to another medical condition

- HF is not a numeric value retrievable in EPIC
- HF patients are cared for by a wide variety of providers

MASSACHUSETTS
GENERAL HOSPITAL

INSTITUTE FOR HEART,
VASCULAR AND STROKE CARE

Bedside Evaluation: Physical Exam Signs of Heart Failure and Heart Failure Severity

S3: relation to $\uparrow$ LVEDP, $\downarrow$ EF
-40% sensitive
-90% specific¹

JVD: manipulate bed angle

Rales: Only present in
2/3 HF presentations²

Proportional Pulse Pressure
 $SBP-DBP/SBP < 25\% \rightarrow$
 $CI < 2.2 \text{ L} \cdot \text{min}^{-1} \cdot \text{m}^2$

Warm vs. cool and wet
“cold” patients, 2x mortality³

Identify the “Trigger”/Precipitant for ADHF

Precipitating Factors	
A dherence to care	-Dietary indiscretion -Nonadherence to medications
D rug Exposures	- βB, CCB, NSAIDs, TZDs - chemo (anthracyclines, trastuzumab)
D irect cardiac insults	-Ischemia -Valve disease (i.e. rupture chordae) -Arrhythmia -Takatsubo CM -Cardiotoxins (EtOH) -RV pacing
Extra-cardiac insults	-Hypertension (RAS, OSA) -Renal failure (AKI, CKD progression) -Anemia -Thyroid dysfunction -Systemic Infection -Extreme emotional distress

2 Year Mortality in Systolic Heart Failure Trials

Beta Blockers with Proven Mortality Benefit in HF

CIBIS = Cardiac Insufficiency Bisoprolol Study; MERIT-HF = Metoprolol CR/XL Randomized Intervention Trial in Congestive Heart Failure; COPERNICUS = Carvedilol Prospective Randomized Cumulative Survival Trial.

Colucci WS et al. *Circulation*. 1996;94:2800–2806. CIBIS II. *Lancet*. 1999;353:9–13.

Hjalmarson A et al. *JAMA*. 2000;283:1295–1302. Packer M et al. *Circulation*. 2002;106:2194–2199.

Evidence based use of Beta-blockers

Dose Escalation Strategy

Beta-blocker	Starting Dose	Target Dose	Reference Trial
Metoprolol XL	12.5mg qd	200mg qd	<u>MERIT-HF</u> 1999, Class II-III
Bisoprolol	1.25mg qd	10mg qd	<u>CIBIS II</u> 1999, Class II-III
Carvedilol	3.125mg bid	25-50mg bid	<u>Packer meta anal</u> 1996, Class I-III <u>COPERNICUS</u> , 2002, Class IV

Comparative Studies: Coreg > Metoprolol Tartrate (COMET)
Coreg vs. Toprol XL unknown

MASSACHUSETTS
GENERAL HOSPITAL

INSTITUTE FOR HEART,
VASCULAR AND STROKE CARE

Evidence based use of Beta Blockers Based on ACC/AHA Classification

ACC/AHA Guidelines All stable patients with current or previous symptoms of HF and reduced LVEF Class I, Evidence A

Coreg > Metoprolol Tartrate (COMET)

Coreg vs. Toprol XL unknown

- Significant blood pressure rise → coreg**

- Marginal blood pressure, concern about non-selective bbck → metoprolol xl**

Evidence Based use of ACE I

Dose titration strategy

ACE I	Initial Dose	Target Dose	Reference Trial
Captopril	6.25mg tid	50mg tid	<u>SAVE</u>
Enalapril	2.5mg bid	10mg bid	<u>CONSENSUS</u> <u>V-HeFT II</u>
Lisinopril	2.5-5mg qd	20-40mg qd	<u>ATLAS</u>
Ramipril	1.25-2.5mg qd	10mg qd	<u>AIRE</u>

CHANGE IN ANGIOTENSIN II DURING LONG-TERM ACE INHIBITOR TREATMENT

Plasma Angiotensin II

Blollasz et al. J Cardiovasc Pharm, 1982

Evidence Based Use of ARBs Based on ACC/AHA Classification

Angiotensin Receptor Blockers

DRUG	BIOAVAIL ABILITY	HALF LIFE	DAILY DOSE Goal (mg)
Losartan	33%	6-9 hours	50-100
Candesartan	15%	9 hours	16-24
Valsartan	25%	6 hours	160-320
Telmisartan	50%	24 hours	40-80

MASSACHUSETTS
GENERAL HOSPITAL

INSTITUTE FOR HEART,
VASCULAR AND STROKE CARE

Angiotensin Receptor Blockers in the Treatment of Heart Failure

- ARBs are better tolerated than ACE inhibitors
- ARBs are comparable to ACE I for first line therapy in HF (ELITE I, II)
- ARBs should be substituted for ACE I in bradykinin-mediated ACE I intolerance (CHARM Alternative)

MASSACHUSETTS
GENERAL HOSPITAL

VASCULAR AND STROKE CARE

Aldo-Receptor Blocker Trials

RALES

1663 pts, NYHA III-IV, LVEF < 35%

Rx with loop diuretics (100%) with omission of KCl unless $K < 3.5$

Average dose: **26 mg/d**

EPHESUS

6634 pts, 3-14 days post-MI, Evident HF, LVEF < 40%

16 month follow-up

Target dose: **50 mg/d**

-15% reduction in all-cause mortality ($p=0.008$);

-13% reduction in combined end-point of CV death or hospitalization ($p=0.002$)

Exclusion Criteria:

Cr > 2.5, K > 5.0

Use of K-sparing diuretics

Trial Designs:

Frequent electrolyte monitoring

Aldo-Receptor Blocker Trials

EMPHASIS

2737 pts, NYHA II, LVEF < 35%

Rx with ACE/ARB, BB_{lck}, Hosp within 6mo

Excl: K>5.0, GFR<30

Average dose: **40 mg/d**

Placebo-corrected fall in SBP: 2mmHg

K>5.5 in 11.8% vs. 7.2%

Take home points

- Potent anti-remodeling and ↓ mortality at a minimal blood pressure cost
- With use in NYHA II patients who are not on loop diuretics monitor K levels very closely

SHIFT: Heart Rate Modulation Ivabradine

**Selective inhibitor of Na/K channel in the sinus node
N=6505, LVEF<0.35, HR>70, HF hospitalization in last yr**

Outcomes in SHIFT	Ivabradine, n=3241	Placebo, n=3264	HR (95% CI)	p
CV death or HF hospitalization	24	29	0.82 (0.75-0.90)	<0.0001
Death from heart failure	3	5	0.74 (0.58-0.94)	0.014
HF hospitalization	16	21	0.74 (0.66-0.83)	<0.0001
CV death, HF hospitalization, or admission for nonfatal MI	25	30	0.82 (0.74-0.89)	<0.0001

**90% bbick use, comparable to Registry use but < clinical trial goals
Greatest benefit with highest HR.**

2016 ACC/AHA/HFSA Guidelines

Class IIa: Ivabradine can be beneficial to reduce HF hospitalization for patients with symptomatic (NYHA class II-III) stable chronic HFrEF (LVEF $\leq 35\%$) who are receiving GDEM, including a beta blocker at maximum tolerated dose, and who are in sinus rhythm with a heart rate of 70 bpm or greater at rest

Digoxin ($\leq 0.125\text{mg/d}$)

Evidence:

DIG: Neutral mortality, decreased HF hospitalizations, levels $< 1\text{ ng/ml}$ preferable

RADIANCE: Withdrawal of digoxin $\rightarrow$ 5X RR of HF hospitalization, decr LVEF

Positives:

Adjunctive rate control in HF with AF

Reduces HF hospitalizations

Positive inotrope without harm

Negatives:

Narrow therapeutic index

Unknown outcomes with BB/CC

Polypharmacy w/o incr survival

Emerging Targets and Treatments: HFrEF

The Influence of Iron on Functional Capacity in Heart Failure

Gold Standard Objective Measurement of Functional Capacity

Background and Rationale: Prevalence of Iron Deficiency in HFrEF

-Iron (Fe) Deficiency is common in HFrEF

Incidence

- 70%: ↓ bone marrow iron¹
- 35-61%: ↓ ferritin, T-sat ^{2,3}
- 25-42%: without anemia³

International Pooled Analysis (Klip I et al, AHJ 2013)

1506 patients with LVSD (Ferritin < 100 ug/L or 100-299 ug/L with Tsat < 20%)

50% had iron deficiency

Fe deficiency (but not anemia) independently predicted mortality (HR=1.42 1.14-1.77, P=0.002)

- No consensus guidelines on when, how, and whether to treat Fe Def in HF
- Oral Fe is inexpensive and readily available without reliance on industry support
 - Oral iron repletion in HF has not been investigated*

1. Nanas, JN JACC 2006

2. Grzeslo, A Eur Heart J 2007

3. Klip IT, AHJ 2013

4. Anker S, NEJM 2009

MASSACHUSETTS
GENERAL HOSPITAL

VASCULAR AND STROKE CARE

IV Iron Repletion Trials in HFrEF

Drug	Authors/ Journal	N	Subjects Studied	Fe-Def Definition	Time	Primary Endpoint	Findings
IV Iron Sucrose	Tobilli <i>JACC 2007</i>	40	NYHA 3-4 LVEF<0.35	Ferritin<100 ng/ml and/or Tsat<20%	5 wks	Δ Global Assessment score	↑ PGAS, ↑ 6MWT ↑ NT-BNP, ↑ LVEF
IV Iron Sucrose	Okonko <i>JACC 2008</i>	35	NYHA 2-3 LVEF<0.35	Ferritin<100 ng/ml or 100-300 with Tsat<20%	16 wks	Δ peak VO ₂	↑ PGAS, ↑ NYHA ↑ Peak VO ₂ α Δ Tsat
IV Iron Carboxy maltose	Anker <i>NEJM 2009</i>	459	NYHA 2-3 LVEF<0.4 Hb 9.5-13.5	Ferritin<100 ng/ml or 100-300 with Tsat<20%	24 wks	Δ Global Assessment Score	↑ PGAS, ↓ NYHA ↑ 6MWD Similar benefit Hb<>12
IV Iron Carboxy maltose	Ponikowski <i>EHJ 2014</i>	304	NYHA 2-3 LVEF<0.45 Hb <15	Ferritin<100 ng/ml or 100-300 with Tsat<20%	52 wks	Δ 6MWD	↑ PGAS, ↓ NYHA Similar benefit Hb<>12 ↓ HF hospitalizations

Challenges and Unanswered Questions:

1. No consensus guidelines on when, whether, and how to treat Fe deficiency in HF
2. IV Fe is expensive (\$4,000/dose) and requires repeated IV infusions (5+ in trials)
 - IV Rx studies: Blinded + unblinded study staff, 6% injection site reactions
3. The efficacy of oral iron repletion in HF is unknown despite its low cost and availability

What About Oral Iron Repletion in HF?

High dose oral iron minimally repleted iron stores and did not improve peak VO₂ in patients with iron deficiency and HFrEF

Lewis GD, JAMA 2017

CV admission			x				
Exclude	nonardiac causes		nonmyocardial disease				
BNP/NT-proBNP		alternative to echo: >=100/>=300 (acute) or >=35/>=125 (non-acute)		alternative to HF admission: >=100/>=360	NT-proBNP >=400 or elevated filling pressures at time of NT-proBNP<400		

HFpEF Trials: TOPCAT

- Treatment Of Preserved Cardiac function heart failure with an Aldosterone anaTagonist
- NHLBI sponsored trial; n=4500 patients randomized to an aldosterone antagonist versus placebo, LVEF > 45%; age > 50 years; controlled blood pressure; $K^+ < 5.0$ mEq/L
- Endpoints: CV mortality, aborted sudden cardiac death, or hospitalization

Next Steps in HF Treatments

There is an unmet need to apply heart failure physiologic subphenotyping in order to improve targeted approaches to interventions.....

Candidate Subphenotypes

Obesity with normal cardiometabolic capacity

Isolated/Predominant LV dysfunction

Abnormal peripheral function: impaired oxygen utilization

Chronotropic incompetence

Right Ventricular - Pulmonary Vascular Dysfunction

ACC/AHA GUIDELINES ON PAHRMACOLOGICAL TREATMENT OF DIASTOLIC HEART FAILURE

<u>Recommendation</u>	<u>Class</u>	<u>Level of Evidence</u>
Treat hypertension in a in accordance with guidelines	I	A
Control ventricular rate in atrial fibrillation	I	C
Diuretics to control congestion	I	C
Beta-blockers, ACE-I, ARBs <i>or</i> calcium channel blockers may ↓Sx	IIa	C
Digitalis may reduce symptoms	IIb	C

THANK YOU
